 Vibrating device for attachment to child's cot to induce sleep - has elastic holders for ends of legs of cot, which receive vibration transmitted from vibrator to cause multiple oscillations

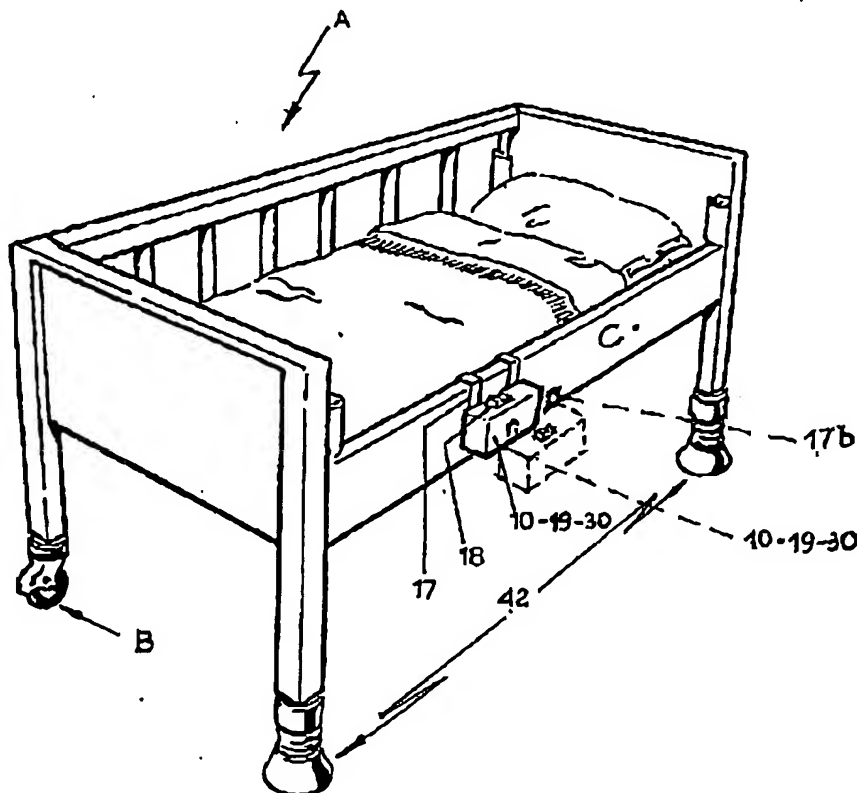

MAKERIDEA SRL 97.10.15 97TF-U'FO0209

X27 (98.12.17) A47D 7/00

98.10.08 98DE-U2017858

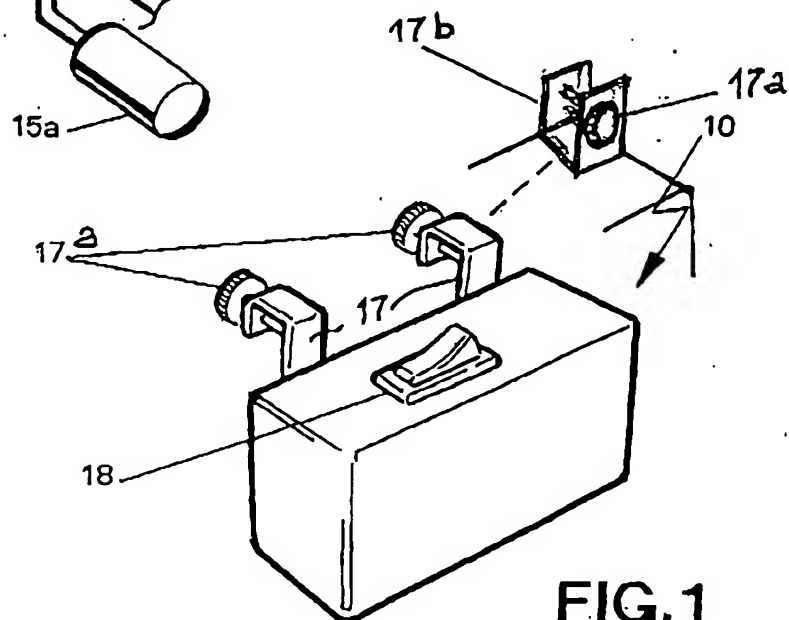

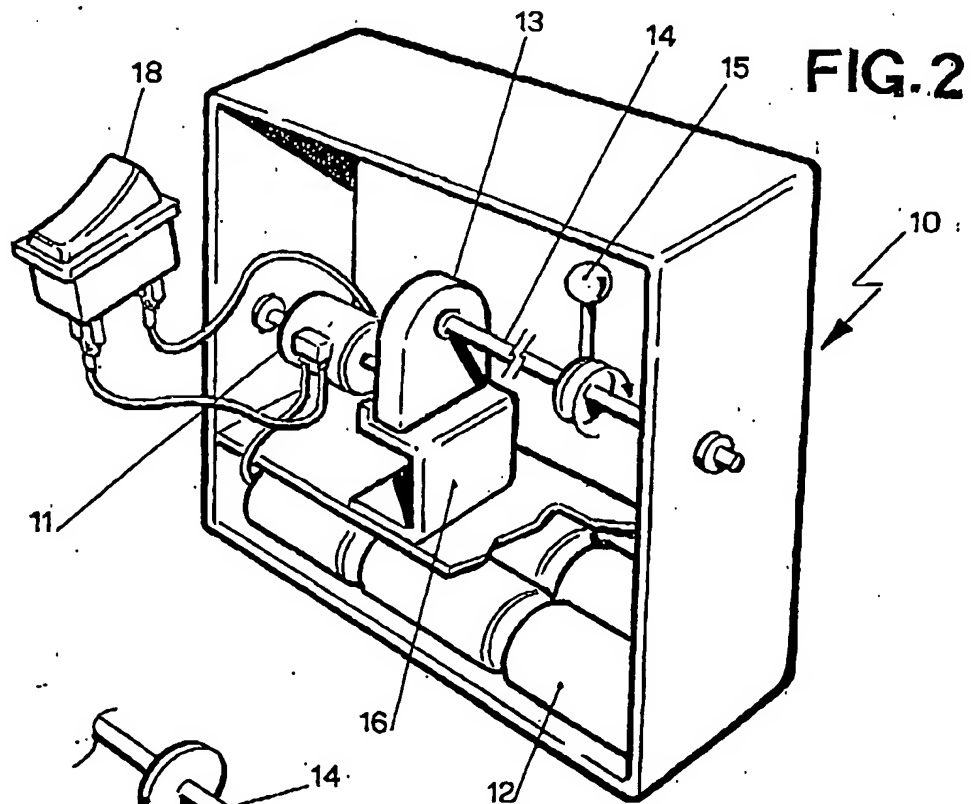

The vibrating device comprises a vibrator and a pair of elastic holders devices for attachment to the bottom of two legs one side of the cot. The vibrations transmitted from the vibrator into the cot are also transmitted into the pair of elastic holders, to cause multiple oscillations. The elastic holders are calibrated cylindrical springs or other elastic material. The elastic holders are terminated on the floor with suction pads or other such sleeve. An electric motor moves an eccentric mass to generate vibrations, and may be powered by low voltage batteries.

ADVANTAGE - Simple, low-weight structure. Safe. (16pp Dwg.No.6/8)
